If I suspected that I had Cancer

• I would not ignore symptoms, hoping it goes away
• I wouldn’t think of it as a death sentence
• I would use the best of both worlds
• I would get a second opinion on ANY treatment… medical or natural

What Causes Cancer To Develop?
1. pH imbalance (primary source of inflammation)

Body Fluids pH Norms
• Saliva 6.3 – 6.6
• Cell Fluids 6.3 – 6.6
• Urine 5.5 - 6.8
• Skin 5.5
Cancer Connection

• When an abnormal cell develops, the body's immune system sends an enzyme to open the pore of the cell, causing fluid to fill up the abnormal cell resulting in the cell bursting
• The immune system can then carry away the abnormal cell fragments
• Enzymes can not work in an acidic medium
• So if the fluid surrounding the body’s cells are acidic, the acid will kill the enzyme and it can no longer work on the cancer

Suggestions to help combat a pH imbalance or Inflammation

What Causes Cancer To Develop?

2. Viruses – Sluggish Immune System (Tramp)

Cancer caused by viruses typically are contracted by:
• Blood line (parents)
• Blood to blood transfer
• Sexually transmitted

These Viruses are not transferred through casual contact
