### What Causes Cancer To Develop?

1. pH imbalance (primary source of inflammation)

#### Body Fluids pH Norms

- Saliva 6.3 – 6.6
- Cell Fluids 6.3 – 6.6
- Urine 5.5 - 6.8
- Skin 5.5

MarysHerbs.com

---

---

---

---

---

---

---

---

### Cancer Connection

- When an abnormal cell develops, the body's immune system sends an enzyme to open the pore of the cell, causing fluid to fill up the abnormal cell resulting in the cell bursting
- The immune system can then carry away the abnormal cell fragments
- Enzymes can not work in an acidic medium
- So if the fluid surrounding the body's cells are acidic, the acid will kill the enzyme and it can no longer work on the cancer

---

### Suggestions to help combat a pH imbalance or Inflammation

- pH balancing diet
- pH Green Zone
- MSM – alkalizes and detoxes
- Herbal Beverage (fosters friendly bacteria)
- Liquid Chlorophyll
- The proper calcium for your pH. Skeletal strength or Liquid Calcium

## What Causes Cancer To Develop?

### 2. Viruses –Sluggish Immune System (Tramp)

Cancer caused by viruses typically are contracted by :

- Blood line (parents)
- Blood to blood transfer
- Sexually transmitted

These Viruses are not transferred through casual contact

## What Causes Cancer To Develop?

Worldwide, the WHO International Agency for Research on Cancer estimated that in 2002 17.8% of human cancers were caused by infection, with 11.9% being caused by one of seven different viruses. Parkin, Donald Maxwell (2006). "The global health burden of infection-associated cancers in the year 2002". *International Journal of Cancer* **118** (12): 3030. [doi:10.1002/ijc.21731](https://doi.org/10.1002/ijc.21731). PMID 16404738.
